

Hello Shayl,

I hope you are doing well! I am Shikha Nukala and I will be providing feedback on your Project 1 Storyboard and Script. It is clear from one read through that your project involves building a facial gesture-to-keyboard command mapping tool that can be utilized by people with limited motor control to take exams, play short games, and make browsing more efficient. Your target audience seems to be geared towards people who are interested in using Gesture, and I think you made a good choice by putting the technical script before the instructional script since a lot of your audience members won't have a technical background. Your overall pace is good in the script. You clearly split up the three main example sections. For your second example (Workflow Optimization), I am a bit confused from reading the script. I understand that you are able to gesture out an entire URL and search, but why is this optimization feasible/better than browsing? Is gesturing out an entire URL more convenient for someone with limited motor skills or would scrolling involve less expenditure? Is there a real-world scenario you can provide to support this feature? There definitely is, so adding that to your script along with demonstrating in the video would remove these potential questions. Overall the proposed video imagery sounds very interesting and will definitely be the highlight of your project. Great script writing! Please let me know if you have any follow up questions.

Hello Kristofer,

I hope you are doing well! I am Shikha Nukala and I will be providing feedback on your Project 1 Storyboard and Script. From your storyboard, I understand that your project involves building a simplified Instagram application. However, your motivations behind simplifying Instagram in your application are not apparent from your storyboard. I believe you are trying to showcase how Instagram works by showing its features in your simplified application. If that is the case, then answering some of these questions directly in your script might be beneficial to make your purpose clear: What motivated you to choose this idea? Who is your target audience and why would they benefit from watching your video? Answering these before moving to box 2 content would be helpful for the intended audience. Your pacing for the storyboard is good, but I think you can make it even more detailed by extending on some of the boxes. For example, in box 3 you describe sharing some of the features of your application and how they will compare to Instagram's. You can make a few storyboard boxes after this and list out each of those features and how you intend them to compare to Instagram's. Going through the next couple boxes in your storyboard, you seem to be explaining how your application stores user data on a backend level, how the fetching and sorting algorithm works, and how the login method is secure. I think it makes more sense in terms of what you do chronologically to put the two login story boxes either before or after box 3 (high-level diagram). That way, your video order will be login, application structure, "homepage" (posts, comments, likes), opening another profile, and searching using the search bar. In fact, you can also place search using the search bar before opening another profile to make the order mimic how an actual user would perform actions. Overall this is a strong start to planning your video. Please let me know if you have any follow up questions.
