

Names: Anusha Chinthamaduka (anushac), Shikha Nukala (desigirl), Kristofer Nika (knika)

Round 1 Client Interview Notes:

- An app that students can use to organize casual sports games. Instead of a typical chat application.
- People in the app note down which game they want to play, the app matches people nearby who want to play the same game.
- For people in college, community members, or people out of town.
- Measure success of the project - successful if it is used by community members and students widely. They should be getting value out of it.
- Risks: go through stages of development and no interest from the target population.
- Other stakeholders to consider: people who would use the app (students and athletes), sponsors for the app
- Timeline for the application development: launched and functioning in April

Round 2 Requirement Drafting Notes:

- Chat functionality is definitely something we want to implement
- We are not as interested in algorithms automatically matching people right now because of the timeline and that is something we see as more in line with competitive play rather than pick up games, but it could be added down the line
- Geo-location functionality is a must, as we want players to be able to find their games without having to close the app and we want players to be able to see games based on distance from them
- User profiles and user information is also something we want, like being able to pick what sports you play and what days/times you are available
- Being able to filter games based on your skill, age, gender, handicap preferences is a must

Requirements

- Users should have the ability to select multiple sports that they are interested in
- Users should have the ability to choose the range of number of players they want to be in a team with
- Users should be able to chat directly within the application (should not migrate to other applications like Imessage or Whatsapp)
- Applications should match users based on game play preferences
- All users are able to connect to people that match their preferences (gender, age, communities, athletic ability)
- Users should provide location access to help personalize the application
- Ensuring that the target audience knows about the application through marketing
- The applications should be developed and functional by end of April
