

Accessibility Audit Reflection - Shikha Nukala

During our team's Accessibility audit, I participated in running the aXe validator on the homepage, "contact us," "about us," and "find pints" pages on the "Milk & Froth" website. After running the aXe validator, I logged the issues that were shown in the full page scan report for each webpage. Some of these issues included color contrast that did not meet WCAG guidelines for accessible test on all pages, an unresponsive link on the "find pints" page, and warnings regarding the organization of headers in the html of the homepage and "find pints" page. I added these issues to our team's presentation under the "Website Findings" section. Additionally, I did research on the statistics of people who eat ice cream and approximately how many of these people have disabilities. I added these statistics to the presentation to display the significance of ensuring this company's website is accessible. I also added information about populations that can be affected by this website's accessibility, including elderly individuals with visual and motor impairments and students with dyslexia and color blindness. I finished this section by explaining how making the website accessible can have positive impacts on the "Milk & Froth" business by adhering to all of their customer base.

By completing the Accessibility audit on the website of "Milk & Froth," I learned that a lot of automated testing depends on using human testing and does not solely rely on online validators such as Wave and aXe. The issues with the focus and font of the website were not caught by these validators, and it was up to me to see these issues and consider them from the lens of a person with different motor and visibility capacities. I also noticed that automated accessibility testing is very simple to do when considering how to build a website. I am surprised that only 3% of the web is accessible when automated testing can be done in an hour's time like our team did. When navigating through various accessibility problems, I realized that for someone with total blindness, there is not a good keyboard shortcut to read out text in an audible format to a user. I know other webpages have this feature, especially websites that exist on Google. I am curious how this is implemented when making a website accessible and would want to explore this accessibility feature in the future.

Group members contribution:

- Eva Park
 - Checked website accessibility as a whole by navigating through the web pages.
 - Added suggestions to fix the navigation bar in the audit report.
 - Edited presentation to fix errors.
- Colin Harris
 - Also ran aXe validator on all pages.
 - Took screenshots of accessibility testing in Firefox Accessibility view.
 - Added online testing tools used to the presentation.
- Evan Chechak
 - Ran W3 validator on all pages.
 - Found color contrast issue on all pages with Wave.
 - Added overview of issues to the "Website Findings" in the presentation and an overview of items to check.
