

Submission 1

Your purpose for writing seems to be to provide two distinct comparisons of variables correlating to SuperHosts and Neighborhood Contrasts as two categorical variables you have compared as per the prompt and SuperHosts by Price Comparison as a categorical and quantitative variable you have compared as per the prompt. You are using evidence from the bar graph you have compiled of the categorical variables comparison to conclude that the presence of SuperHosts in most neighborhoods is minimal. You have written that this trend should signify that the relevance of SuperHosts should be reprioritized, but my understanding of this claim is that the SuperHosts should be removed from the housing category, so this suggestion is confusing to me when reading. The order of this draft follows the prompt well, with the first section being the one described above and the second section being the next. You use evidence such as the mean and the IQR of the boxplots of the categorical and quantitative plot to show that the correlation between the two boxplots is relatively equal, with the spread being larger for Non-SuperHosts. In your conclusion, the main point from my perspective is that you suggest that the Super-Host category is not relevant to users of Airbnb. I like how your flow of ideas follows the prompt and builds on prior points toward the conclusion.

Your goal was to showcase two variable relationships, provide observations about them, and build a conclusion based on those observations. You do this very well by starting off with stating your goal, which sets up a compelling read. Your thought process is very clear because you add the graphs before your observations, allowing the reader to review them. You also set up a good thought process by stating your main observations from the graph (like pointing out that SuperHosts are much less in frequency than Non-SuperHosts) then you provide reasoning as to why that may be the case (in your example: pricing). This makes your reasoning compelling to the reader. You also use the connecting phrase “delve deeper” which refines your writing and connects your two sections together in preparation for the conclusion.

Firstly, your writing in the first section after the first graph is compelling with your observations and inferences, but you write that SuperHosts need to be reprioritized by the manager. This makes the path to the conclusion and final recommendation confusing to the reader and is not clear, so I would suggest you instead point out that SuperHosts should be removed, not reprioritized, to make the readers move toward the conclusion faster. Additionally, the prompt states that for the second section, you must provide exact numerical evidence to support your observations. In the third paragraph, you state that the medians and IQRs are the same, but in order to complete the requirements, you should add in the numerical values of these. Lastly, in your conclusion, you vaguely refer to the Non-SuperHosts offerings as the better category to observe instead of SuperHosts and Non-SuperHosts, but you say there needs to be a

direct focus on outreach and rooms. Add a few sentences to this conclusion to describe how you would recommend creating another category/using an existing category to address this disparity so that your recommendations can be better understood by the reader.

Submission 2

Your purpose for writing seems to be to provide two distinct comparisons of variables correlating to SuperHosts and Parking Status as two categorical variables you have compared as per the prompt and Pool Status by Review Scores as two other variable comparisons. The order of this writing starts with your goal of writing. Then you continue onto the two sections of variable comparison with graphs provided before each summary, then you offer a conclusion. Your first variable comparison uses evidence from the graph to suggest that parking for SuperHosts is higher in proportion compared to the parking available for Non-SuperHosts. You advise the reader to think about parking solutions to curb the difference in proportions. You also describe the second graph and variable comparison by using the data to analyze the trends of the boxplots. The main point of this writing from my perspective is to offer the reader two different Airbnb suggestions based on the data studied in both sections.

Your goal was to showcase two variable relationships and provide observations, inferences, and suggestions based on the analysis of the data plotting the relationships. Your writing is clear and straightforward because you follow the prompt structure well by adding the two sections before the conclusion. Your writing is effective because you state the trends in the graphs (like the proportion difference in the first graph) and offer ideas for change based on the trends you observed. Your writing is refined and uses proper grammatical and sentence structure to sound professional. Your headers before each section help organize your writing and tell the reader what you are going to describe in the section.

Firstly, in your first section, you describe the relationship between the two variables with the proportions derived from the graph, but you do not provide inferences or possible explanations about the trend you found. I suggest you add a sentence or two describing possible reasoning for the trend between the two variables and then use those inferences to build on your suggestion for change. Additionally, in your second section you compare the two boxplots by counting the number of outliers and looking at the distributions, but to back up your claims and follow the guidelines of the prompt, you should add numerical evidence to support your claim that both data sets are similarly distributed (such as by IQR and median).
